

Atoms and Elements Guided Notes

- Atoms are incredibly small
- 1. An **atom** is the smallest identifiable unit of an element.
- 2. An **element** is a substance that cannot be broken down into simpler substances.
- 3. **Democritus** called atoms “atomos” which means indivisible.
 - first scientist to postulate that matter is composed of atoms.

Dalton's Atomic Theory:

1. Each element is composed of tiny, indestructible particles called atoms.
 2. All atoms of a given element have the same mass and other properties that distinguish them from the atoms of other elements.
 3. Atoms combine in simple, whole-number ratios to form compounds.
-
4. Who is given credit for discovering the electron? **JJ Thomson**
 5. Thomson used the **Plum Pudding Model** to describe his discovery mentioned above.
 6. Who is given credit for discovering the atomic nucleus? **Rutherford**
 7. Rutherford used the **Gold Foil Experiment** to describe his discovery mentioned above
 8. **Protons** and **Neutrons** have charge

Protons	Neutrons	Electrons
-Positive Charge	-Neutral Charge	-Negative Charge
-Equal to the Atomic Number	-1 amu	-1/2000th amu
-1 amu	-Dwells in the Nucleus	-Dwells outside the Nucleus
-Dwells in the Nucleus	-Causes isotopes	-Causes ions

9. Like charges **repel**
10. Opposite charges **attract**
11. **Demitri Mendeleev** organized the periodic table
12. The elements in the periodic table can be broadly classified as metals, nonmetals, and metalloids

Metals	Metalloids	Nonmetals
-Occupy the left side of the periodic table	-lie along the zigzag diagonal line dividing metals and nonmetals.	-occupy the upper right side of the periodic Table
-Good conductors	-Metalloids, also called semimetals, display mixed properties	-The dividing line between metals and nonmetals is the zigzag diagonal line running from boron to astatine
-Metals can be pounded into flat sheets (malleability).	-Metalloids are also called semiconductors because of their intermediate electrical conductivity, which can be changed and controlled	-Nonmetals have more varied properties; some are solids at room temperature, while others are gasses.
-Metals can be drawn into wires (ductility).	-This property makes semiconductors useful in the manufacture of electronic devices that are central to computers, cell phones, and other modern gadgets	-As a whole, nonmetals tend to be poor conductors of heat and electricity.
-Metals are often shiny (lustrous).	-Silicon, arsenic, and germanium are good examples of metalloids.	-Nonmetals tend to gain electrons when they undergo chemical changes.
-Metals tend to lose electrons when they undergo chemical changes forming positive ions.	-Silicon is shown here	-Good examples of nonmetals are oxygen, nitrogen, chlorine, and iodine
-Good examples of metals are iron, magnesium, chromium, and sodium		

Alkali metals		Alkaline earth metals												Halogens		Noble gases	
1A	2A	Group numbers										3A	4A	5A	6A	7A	8A
1	2											3	4	5	6	7	8
H	He											B	C	N	O	F	Ne
3	4	Transition metals										13	14	15	16	17	18
Li	Be											Al	Si	P	S	Cl	Ar
11	12											31	32	33	34	35	36
Na	Mg											Ga	Ge	As	Se	Br	Kr
19	20	21	22	23	24	25	26	27	28	29	30	41	42	43	44	45	46
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	In	Sn	Sb	Te	I	Xe
37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	57	58	59	60	61	62
55	56	57	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86
Cs	Ba	La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn
87	88	89	104	105	106	107	108	109	110	111	112	113	114	115	116	117	118
Fr	Ra	Ac	Rf	Db	Sg	Bh	Hs	Mt	Ds	Rg	Cn	Nh	Fl	Mc	Lv	Ts	Og
Lanthanides		58	59	60	61	62	63	64	65	66	67	68	69	70	71		
Actinides		90	91	92	93	94	95	96	97	98	99	100	101	102	103		
		Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No	Lr		

13. Positive ions are called **cations** (loss of electrons)

14. Negative ions are called **anions** (gain of electrons)

15. Atoms with the same number of protons but different numbers of neutrons are called **isotopes**.

16. All elements have their own unique percent **natural abundance** of isotopes

17. mass= **protons** + **neutrons**
